

Create an instance in the US-East-1 (N. Virginia) region with an Ubuntu OS and install Nginx for making them web servers.

The image displays two sequential screenshots of the AWS Management Console, specifically the 'Launch an instance' page in the US-East-1 (N. Virginia) region.

Top Screenshot: This view shows the initial configuration options. The instance name is 'myinstance-assignment'. Under 'Application and OS Images (Amazon Machine Image)', the 'Ubuntu' option is selected. The 'Summary' panel on the right indicates 1 instance, using the 'Canonical, Ubuntu, 22.04 LTS' AMI, 't2.micro' instance type, and a 'New security group'. The 'Launch instance' button is visible at the bottom right.

Bottom Screenshot: This view shows the 'Network and Firewall' configuration. The 'Subnet' is set to 'No preference'. 'Auto-assign public IP' is enabled. Under 'Firewall (security groups)', the 'Create security group' option is selected. The 'Security group name' is 'assignment-sg', and the 'Description' is 'launch-wizard-3 created 2023-07-16T05:21:44.831Z'. The 'Summary' panel remains the same. The 'Launch instance' button is again visible at the bottom right.
